Replacing objects (objects must have a set number of parts) AutoCAD can do all the basic operations to reduce the number of objects in a drawing. The most basic operations available are; Combine/Merge, Unlink, Re-Shape, Move/Re-position and Remove/Hide. If a drawing contains too many objects the command Hide/Remove will cause unnecessary toolbars to be removed. This can be reversed using the 'View/Hide Visible' command. Replacing objects is more complex, since some operations can remove objects not visible in the current view, whereas others may remove all hidden objects, and there is a risk of deleting the wrong objects. A few commands can affect multiple objects and allow the user to choose which objects to be affected. The Delete Selected Objects command can be used to delete all objects in the current view or in the current drawing (which can contain many views). This can be reversed by pressing 'Shift+Delete' or selected objects can be marked with the Mark command. A number of commands can also affect objects in the current drawing. The Visible command can be used to show or hide objects and remove all objects or marked objects. The Align/Distribute command can be used to set the rotation of multiple objects, or to set the rotation of individual objects. The Draw Order command can be used to specify an order for objects to be drawn. The command can be used in combination with the Set Drawing Order command to specify the order of objects to be drawn in the current drawing. A list of all the objects in the current drawing is displayed, allowing the user to set the order of drawing. The Select Objects command can be used to select objects that are not already selected, or can be used to select objects in the current drawing. The command can be combined with the Cut/Copy/Paste commands to specify which objects to cut/copy/paste. The Interactive Drawing Labeling command is similar to the Object Label command and allows labels to be placed on objects in the current drawing. A number of commands can be used to set properties for objects. The properties are specified as a series of key: value pairs, where the value is a property, type, or expression that specifies the property. The command Set Properties for Selected Objects can be used to specify properties for objects in the current drawing or the current view. Properties can also be set by the user using commands such as Select/Set Properties or Mark/Set a1d647c40b

Add and edit comments to your drawings. Comment on layers, objects, or drawings in a single step. Add comments using your favorite text editor or by handwriting. (video: 1:44 min.) More info One of the most requested features since AutoCAD LT was introduced in 1990, the Markup Assist function has been re-designed to meet the needs of today's users. The original Markup Assist was limited to outlines and object properties, such as lines, circles, arcs, and ovals. Users were required to activate Markup Assist to see all the new properties in each editable object, such as holes and text. Today, the Markup Assist table will display a new set of properties for you, so you can quickly see the changes you made to your drawing. Rapid Response to Feedback is now built-in, and there are no additional tools or views to activate or enable. The existing feature of rapid response to feedback, called the Markup Import function, will now be known as Markup Import and Markup Assist. The new function allows you to quickly send feedback to your drawing, incorporating changes to one or more objects, in a single step. All you need to do is to select the objects you want to send and click Import. When you import feedback into your drawing, the Markup Import and Markup Assist dialog box will automatically open, ready to view and make changes to the imported objects. When you edit or add comments to one object, all objects in the drawing, including hidden objects, will be updated. Custom Views: With Custom Views, you can create a new view of your drawing, customized to meet your needs. This view will be displayed in the Custom Views window, so you can easily see the customized view of your drawing at a glance. This feature will help you save time by letting you see all the objects in your drawing with a single click. With your saved custom view, you will be able to see all the objects in your drawing at a glance and select specific objects as required. Over 400 new commands for the Planning Utilities panel Simple ways to add, change, or remove notes for your drawings User Interface Improvements: The user interface, including the user command bar and the customizable ribbon, has been completely redesigned to be easier to use and to take full advantage of Windows 8.
