5. \*\*Click and drag the Layer Mask icon to blend the two layers together.\*\*  
\*\* When you're done manipulating the original layer, you can hide it by clicking the eye icon, and then reveal the altered layer to see how the two layers look together. Photoshop enables you to hide the pixels in an image

---

that you don't want to show. You can mask out portions of any layer in an image. The masked-out areas don't affect the rest of the original image. You can edit the layer mask without resetting any of the layers beneath it. Simply click the Layer Mask icon and drag over the area you want to edit. 6. \*\*Click OK to continue with the image.\*\* You can add some additional textures

---

and details to the drawing now that you can see the original image. Photoshop layers come in two basic flavors: `_smart objects_` (objects that can retain their state when you change them) and `_regular layers._` Smart objects may be layers within layers or layers within other layers. You can manipulate smart objects independently of regular layers,

---

which makes them the most versatile tool. When working with layers you can either select an object or a selection and alter it. You can apply any of Photoshop's standard effects — such as blurring or sharpening — to a layer. You can also create a selection from an existing layer or create a new one. You can easily resize a layer by using the Layers

---

panel's Resize tool. You can change the layer's blending mode, opacity, and color. Additionally, you can select the contents of a layer and either copy it to a different layer, adjust it, or both.

Rheological and chemical

exopolysaccharide of the red-

*thetaiotaomicron* VPI-5482.

VPI-5482 is a strain of the Gram-  
negative *Bacteroides*

---

thetaiotaomicron isolated from human feces. It produces a flexible exopolysaccharide that has been shown to be attached to the cell wall of this bifidobacterial species and to be a likely component of *B. thetaiotaomicron*'s matrix. Here we present results showing that the exopolysaccharide was a pseudoplastic fluid or gel at low shear rates. At high shear rates, the

---

exopolysaccharide was fluid. The pseudoplastic response was consistent with a yield stress that was dependent on the strain and state of cell growth and occurred over a temperature range of 4-45 degrees C. These findings are similar to those reported for *B. vulgatus* and suggest that yield stress is a general property of many exopolysaccharides produced by

---

Bacteroides spp. The yield stress in the VPI-5482 exopolysaccharide occurred at a relatively low concentration (0.5 g of exopolysaccharide/100 ml of culture) and corresponded to a viscosity of 5.3 cP. The concentration and viscosity of the exopolysaccharide were influenced by its state of growth and the strain of Bacteroides species that

---

produced it. The exopolysaccharide of VPI-5482 is similar to the exopolysaccharide secreted by some *Bacteroides* species but is different from the exopolysaccharide of *B. vulgatus*, which is a very viscous, elastic fluid. The viscosity and concentration of this polysaccharide may influence the growth and metabolism of
